

Bindu Reddy

Bengaluru, India

bindu.jobsearch@gmail.com — +91 9187467369

Professional Summary

Backend Engineer with 3.7 years of experience building scalable microservices using Java and Spring Boot. Specialized in event-driven architecture using Apache Kafka, handling high-throughput systems (1M+ events/day). Experienced in developing and deploying production-grade applications on AWS using Docker and Kubernetes. Hands-on exposure to Cloud AI integrations and developer productivity tools like GitHub Copilot. Strong focus on performance optimization, system reliability, and clean architecture.

Technical Skills

Languages: Java (8/11/17)

Frameworks: Spring Boot, Spring MVC, Spring Data JPA, Hibernate, Spring Security

Architecture: Microservices, REST APIs, Distributed Systems, Event-Driven Architecture

Databases: MySQL, Oracle, PostgreSQL, MongoDB

Messaging: Apache Kafka, RabbitMQ

Cloud & DevOps: AWS (EC2, S3), Docker, Kubernetes, Jenkins, Git, Cloud AI Services

Testing: JUnit, Mockito

Tools: IntelliJ, Eclipse, Postman, SonarQube, JIRA, GitHub Copilot

Frontend: HTML, CSS, ReactJS, JavaScript

Professional Experience

Software Engineer – Synechron

Sep 2022 – Present

Key Contributions:

- Designed and developed scalable microservices using Spring Boot for banking and enterprise applications
- Built and maintained 10+ REST APIs supporting high-reliability production systems
- Developed event-driven microservices using Apache Kafka for real-time data processing
- Improved application performance by reducing API response time (20–30%) through query optimization
- Implemented secure authentication and authorization using Spring Security (OAuth/JWT)
- Worked with PostgreSQL and MongoDB for scalable data management
- Deployed applications on AWS using Docker and Kubernetes
- Built and maintained CI/CD pipelines using Jenkins
- Leveraged GitHub Copilot to accelerate development and improve code productivity
- Handled P1 (critical production) issues, ensuring quick resolution and minimal downtime
- Explored Cloud AI services for enhancing automation and intelligent processing
- Collaborated with cross-functional teams

Projects

Phoenix (Identity & Access Management Platform)

Domain: Banking / Financial Systems

- Developed and maintained Spring Boot microservices handling 100K+ identity records/day
- Built Kafka-based event pipelines processing 1M+ real-time messages/day
- Designed secure REST APIs, reducing authentication and authorization errors by 25%
- Optimized SQL queries and service logic, improving API response time by 30%
- Actively handled P1 (critical) production incidents related to authentication failures and service downtime
- Performed root cause analysis (RCA) for P1/P2 issues and implemented permanent fixes
- Improved system reliability by addressing recurring production defects and edge cases
- Collaborated with DevOps teams for quick rollback and hotfix deployments during incidents
- Enhanced monitoring and alerting mechanisms to proactively detect failures

Fraud Detection System

Domain: Fintech / Payments / Banking

- Designed and developed a real-time fraud detection system using microservices architecture
- Built high-throughput Kafka pipelines for processing transaction streams in real time
- Implemented rule-based fraud detection logic for identifying suspicious transactions
- Developed REST APIs for transaction ingestion, fraud evaluation, and alert generation
- Ensured low-latency processing and high availability for critical transaction workflows

- Handled P1 incidents involving transaction failures and real-time processing delays
- Troubleshoot Kafka lag, consumer failures, and data inconsistencies during P2 incidents
- Improved system stability by optimizing concurrent processing and reducing bottlenecks
- Implemented logging, monitoring, and alerting for fraud events and system health tracking
- Deployed services using Docker and Kubernetes on AWS for scalability

Inventory Management System

Domain: Retail / Supply Chain

- Developed microservices-based inventory system using Spring Boot
- Built REST APIs for inventory tracking, stock updates, and order management
- Integrated Kafka for real-time event-driven communication between services
- Optimized PostgreSQL queries, improving performance and reducing latency
- Resolved P2/P3 issues related to data inconsistency and API failures
- Improved system consistency and fault tolerance across distributed services
- Collaborated with cross-functional teams to deliver stable and scalable features

Education

Bachelor of Technology in Computer Science Engineering

Anna University, Tamil Nadu
